STARTUP INVESTMENT ANALYSIS

Shark Tank Data Analysis

1. Introduction

Startups play an important role in innovation, employment and economic growth. Investment programmes such as Shark Tank provide a platform for entrepreneurs to present business ideas and seek funding. This project studies startup investment patterns across industries, focusing on funding amounts, deal outcomes and founder profiles. The analysis can help identify sectors attracting investment and patterns associated with receiving a deal.

2. Abstract

The project demonstrates how startup pitch data can be organized and analyzed to understand investment trends. Data fields such as industry, amount requested, amount offered, deal status and number of founders are examined. The data is grouped by industry to compare investment totals and deal success rates. Charts are used to communicate the results in a simple dashboard-style format.

3. Tools Used

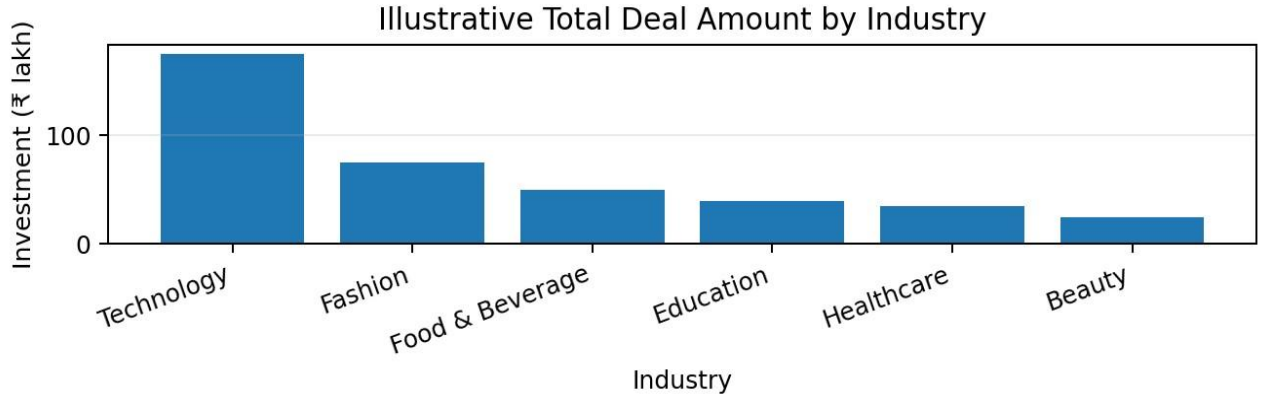

Tool	Purpose
MS Excel	Data entry, cleaning, sorting, filtering and summary tables.
Python (Pandas, Matplotlib)	Data grouping, calculations and chart preparation.
Tableau	Interactive dashboard creation and visual presentation.

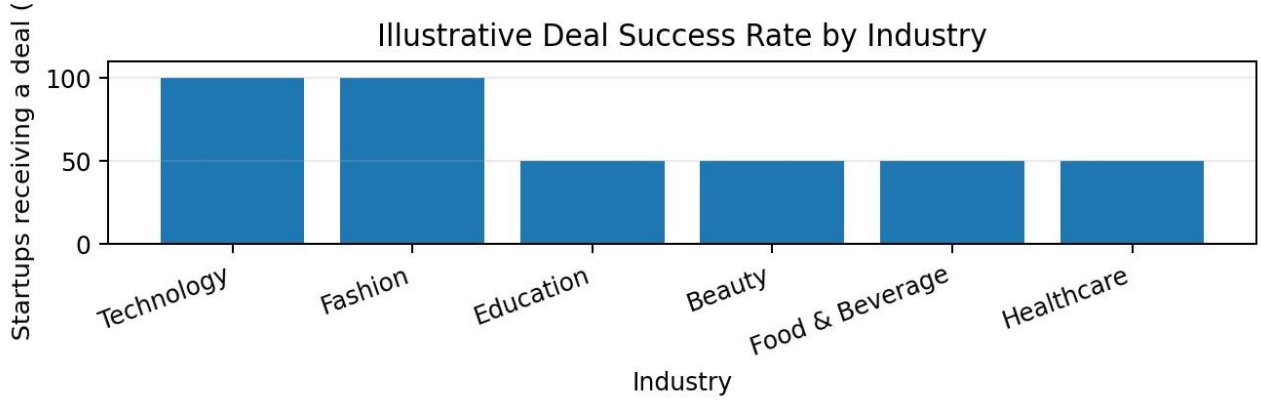

4. Steps Involved in Building the Project

- **Data collection:** Select a relevant Shark Tank India/US dataset containing startup industry, funding ask, deal amount, deal status and founder details.
- **Data cleaning:** Remove duplicate records, check missing values, standardize industry names and convert funding values into a common unit.
- **Data analysis:** Group startups by industry; calculate total deal amount, number of deals and deal success rate; compare founder counts and outcomes.
- **Visualization:** Build industry-wise bar charts and KPI summaries in Tableau. Use filters for industry and deal status.
- **Interpretation:** Identify sectors with higher investment totals and compare deal rates to understand investment patterns.

PROJECT OUTPUT & FINDINGS

5. Visual Output (Illustrative sample analysis)

6. Key Findings

- In the illustrative sample, Technology has the highest total deal amount, followed by Food & Beverage.
- Beauty and Education show different deal outcomes in this small sample, demonstrating why both deal count and deal rate should bereviewed.
- A higher funding request does not automatically result in a deal; investors may consider the business model, market potential andfounder capability.
- Founder count can be compared with deal outcomes, but this sample is too small to establish a reliable relationship.

7. Founder Success Pattern Summary

Founder success should be assessed using more than the number of founders. Useful fields include prior business experience, domain knowledge, product readiness, revenue, market size and clarity of the pitch. These fields can be added to the dataset where available and compared with deal outcomes. The current illustrative sample includes only founder count, so it cannot support conclusions about founder background or experience.

8. Conclusion

This project shows how data analytics can be used to study startup investment trends across industries. Excel supports data preparation, Python helps summarize and visualize the data, and Tableau can present the results in an interactive dashboard. The analysis can support better understanding of industry-wise funding and deal patterns. For final submission, the illustrative sample must be replaced with a verified Shark Tank dataset and the charts and findings regenerated from that data.

Data note: Charts and numerical examples in this report use a small, illustrative sample created only to demonstrate the project output. They are not official Shark Tank India/US statistics and should not be presented as actual findings.
